## ABSTRACT

A METHOD OF MODIFYING IN INDIVISIBLE MANNER A PLURALITY
OF NON-VOLATILE MEMORY LOCATIONS IN A MICROCIRCUIT CARD,
IN PARTICULAR IN A CONTACTLESS CARD

The card is coupled temporarily to a terminal while a transaction is being executed that includes the terminal applying a plurality of modification commands to the card, each comprising at least one operation of recording, in the memory of the card, a respective item of information specified by the command, the various items of information written in this way being mutually interdependent. The method comprises execution by the card of the following steps: a) on receiving corresponding respective commands from the terminal, it modifies the contents of the card memory by provisionally recording in the card memory each of said interdependent items of information without losing prior values corresponding to said items; and then b) the modifications are finalized either by all of them being confirmed or by all of them being discarded, such that for subsequent operations, the commands executed in step a) will either all have been taken into account, or else all of them will be without effect.
